Soil Engineering, Environmental Engineering, Materials Testing, Geology
October 6, 2020
Project No.: 20229-01

TO: San Bernardino City Unified School District Facilities Planning and Development<br>956 West $9^{\text {th }}$ Street<br>San Bernardino, California 92411<br>SUBJECT: Preliminary Soil Investigation Report for Access Ramp at Kimbark Elementary School, 18021 West Kenwood Avenue, San Bernardino, California

In accordance with your authorization, GeoMat Testing Laboratories, Inc. (GeoMat) is pleased to present our Preliminary Soil Investigation Report for the proposed access ramp at 18021 West Kenwood Avenue, San Bernardino, California. This report is in fulfillment of our proposal dated September 29, 2020 and your subsequent authorization. The accompanying report presents a summary of our findings, recommendations and limitation of work for the proposed site development.

The primary purpose of this investigation and report is to provide an evaluation of the existing geotechnical conditions at the site as they relate to the design and construction of the proposed development. More specifically, this investigation was to address geotechnical conditions for the preliminary design of the foundation for the proposed ramp structure.

Based on the results of our investigation, the proposed development is feasible from a geotechnical standpoint and it is our professional opinion that the proposed development will not be subject to a hazard from settlement, slippage, or landslide, provided the recommendations of this report are incorporated into the proposed development. It is also our opinion that the proposed development will not adversely affect the geologic stability of the site or adjacent properties provided the recommendations contained in this report are incorporated into the proposed construction.

We appreciate the opportunity to assist you and look forward to future projects. If you should have any questions regarding this report, please do not hesitate to call our office. We appreciate this opportunity to be of service.

Submitted for GeoMat Testing Laboratories, Inc.

### 1.0 INTRODUCTION

### 1.1 EXISTING SITE CONDITIONS

The subject site is located on the south side of Kenwood Avenue between Kimbark Avenue and Woodlawn Avenue in San Bernardino, California. More specifically, the subject site is the sloped landscaping area located between the school building and the Kenwood Avenue street parking spaces.

This sloped landscaped area generally consists of grass ground cover and several mature trees. The slope gradient is approximately $3 \mathrm{H}: 1 \mathrm{~V}$ for a total height of 12 feet.

### 1.2 PROPOSED DEVELOPMENT

We understand that the site is proposed for an access ramp connecting the upper street level parking spaces to the lower school building level. The ramp will be of a switchback form and be constructed from concrete slab-on-grade and founded on continuous shallow footings.

### 1.3 FIELD WORK

Three exploratory borings were excavated on October 4, 2020 to maximum depth of 4 feet below existing ground surface utilizing manual digging and auguring tools. Sampling was conducted with a Dames and Moore California Ring Sampler (see Exploratory Boring Location Map, Plate 1). This sampler has three inches external diameter, 2.5 inches inside diameter, and is lined with one-inch high brass rings, with an inside diameter of 2.41 -inches. The sample barrel was driven into the ground at the bottom of the excavation with 35 -pound hammer with a free fall of approximately 24 -inches. Sampler driving resistance, expressed as number of blows for 12 -inch of penetration, was recorded. To convert the field blow count to an SPT equivalent, we have utilized the following conversion formula by D.M. Burmister, 1948, "The importance and practical use of relative density in soil mechanics: Proceedings of ASTM, v. 48:1249" and the correlating SPT " N " values can be found in the borehole logs.

### 1.4 LABORATORY TESTING

Laboratory tests were performed on selected soil samples. The tests consisted primarily of the following:

- Moisture Content
- Dry Density
- Sieve Analysis
- Direct Shear
- Soluble Sulfate Content
(ASTM D2216)
(ASTM D2937)
(ASTM D422)
(ASTM D3080)
(Extinction/Turbidimetric Method)

The soil classifications are in conformance with the Unified Soil Classifications System (USCS), as outlined in the Classification and Symbols Chart (Appendix B). A summary of our laboratory testing, ASTM designation, and graphical presentation of test results is presented in Appendix C.

### 2.0 GEOTECHNICAL CONDITIONS

### 2.1 REGIONAL GEOLOGIC FINDINGS

Based on the Geologic Map of the Devore quadrangle (Dibblee Foundation Map DF-105) the site is located in an area mapped as older alluvial fan deposits (Qoa). These deposits are generally described as consisting of low elevated remnants of alluvial gravel and sand.

### 2.2 SUBSURFACE CONDITIONS

Detailed log of the exploratory excavation is presented in Appendix B of this report. The earth materials encountered within the exploratory excavations are generally described below.

Based on our exploratory boreholes, the site soil generally consists of silty sand with gravel (USCS "SM") to the total depth explored of 4 feet below existing ground surface. This material is generally described as loose in the upper 18 inches and become medium dense, dry to slightly moist, and contains few to some gravel.

### 2.3 GROUNDWATER

Groundwater study is not within the scope of our work. Groundwater was not encountered in our exploratory borings excavated onsite to a depth of 4 ' below ground surface.

A contour map showing minimum depths to ground water in the Santa Ana River Valley Region was constructed by the United States Geological Survey (USGS) and subsequently, a report (USGS Map MF1802) was published in 1985. The map was constructed by contouring the shallowest water level measurements reported to the California Department of Water Resources (CDWR) for the period from 19731979. Based on our review of the map, the minimum depth to ground water in the project site area, during this period, may be around 10 feet below ground surface.

Please note that the potential for rain or irrigation water locally seeping through from elevated areas and showing up near grades cannot be precluded. Our experience indicates that surface or near-surface groundwater conditions can develop in areas where groundwater conditions did not exist prior to site development, especially in areas where a substantial increase in surface water infiltration results from landscape irrigation. Fluctuations in perched water elevations are likely to occur in the future due to variations in precipitation, temperature, consumptive uses, and other factors including mounding of perched water over bedrock or natural soil. Mitigation for nuisance shallow seeps moving from elevated lower areas will be needed if encountered. These mitigations may include subdrains, horizontal drains, toe drains, french drains, heel drains or other devices.

### 2.4 EXPANSIVE SOIL

Expansive soils are characterized by their ability to undergo significant volume changes (shrink or swell) due to variations in moisture content. Changes in soil moisture content can result from precipitation, landscape irrigation, utility leakage, roof drainage, perched groundwater, drought, or other factors and may result in unacceptable settlement or heave of structures or concrete slabs supported on grade.

Based on laboratory classification, the upper foundation soil onsite is expected to have a very low expansion potential (El<20), as defined in ASTM D4829. This would require verification subsequent to completion of new footing excavations.

### 2.5 CORROSIVE SOIL

To preliminarily assess the sulfate exposure of concrete in contact with the site soils, a representative soil sample was tested for water-soluble sulfate content. The test results suggest the site soils have a negligible potential for sulfate attack (less than 0.015 percent) based on commonly accepted criteria. We recommend following the procedures provided in ACI 318-19, Section 19.3, Table 19.3.2.1 for exposure "S0". We recommend Type II cement for all concrete work in contact with soil.

Ferrous metal pipes should be protected from potential corrosion by bituminous coating, etc. We recommend that all utility pipes be nonmetallic and/or corrosion resistant. Recommendations should be verified by soluble sulfate and corrosion testing of soil samples obtained from specific locations at the completion of rough grading.

### 2.6 SEISMIC DESIGN PARAMETERS

Based on current standards, the proposed development is expected to be designed in accordance with the requirements of the 2019 California Building Code (CBC). The 2019 California Building Code (CBC) provides procedures for earthquake resistant structural design that include considerations for on-site soil conditions, occupancy, and the configuration of the structure including the structural system and height.

Based on the soils encountered in the exploratory borehole within the subject site and with consideration of the geologic units mapped in the area, it is our opinion that the site soil profile corresponds to Site Class D in accordance with Section 1613.2.2 of the California Building Code (CBC 2019) and Chapter 20 of ASCE/SEI 7-16.

We have downloaded the seismic design parameters in accordance with the provisions of the current California Building Code (CBC, 2019) and ASCE/SEI 7-16 Standard using the Structural Engineers Association of California, OSHPD Seismic Design Maps Web Application (https://seismicmaps.org). The mapped seismic parameters are attached to this report in Appendix D.

The 2019 CBC requires that a site-specific ground motion study be performed in accordance with Section 11.4.8 of ASCE 7-16 for Site Class D sites with a mapped S1 value greater than 0.2. However, Section 11.4.8 of ASCE 7-16 also indicates an exception (exception 2) to the requirement for a site specific ground motion hazard analysis for certain structures on Site Class D sites. Also, the commentary for Section 11 of ASCE 716 (Page 534 of Section C11 of ASCE 7-16) indicates that "In general, this exception effectively limits the requirements for site-specific hazard analysis to very tall and or flexible structures at Site Class D sites."

Based on our understanding of the proposed development, the seismic design parameters presented below were calculated assuming that the exception in Section 11.4 .8 applies to the proposed structure at this site. However, the structural engineer should verify that this exception is applicable to the proposed structure. Based on the exception, the spectral response accelerations presented below were calculated using the site coefficients Fa and Fv from ASCE 7-16 Tables 11.4-1 and 11.4-2.

## 2019 CBC SEISMIC DESIGN PARAMETERS

| Short Period Site Coefficient Fa | 1.200 |
| :--- | :--- |
| Long Period Site Coefficient Fv | 1.700 |
| Mapped Spectral Acceleration at 0.2 sec Period Ss | 2.454 |
| Mapped Spectral Acceleration at 1.0 sec Period S1 | 1.045 |
| Site Class | D |
| Site Modified Spectral Acceleration at 0.2 sec Period SMS | 2.945 |
| Site Modified Spectral Acceleration at 1.0 sec Period SM1 | 1.777 |
| Design Spectral Acceleration at 0.2 sec Period SDS | 1.964 |
| Design Spectral Acceleration at 1.0 sec Period SD1 | 1.184 |

The above tabulated values as well as the values obtained from the website seismicmaps.org (US seismic design maps) are sufficient assuming a site specific ground motion hazard analysis is not required per exception 2 of ASCE 7-16 Section 11.4.8 and Section 11 commentary of ASCE 7-16.

### 2.7 SLOPE STABILITY

The stability of the proposed slope and ramp configuration at the subject site was evaluated by analyzing the elevations obtained from Civil Grading Plan prepared by Sitetech, Inc (Sheet C-3, 06/24/2020) as depicted in our Geotechnical Cross Section A-A' on Plate 2.

### 2.7.1 Soil Strength Parameters

The shear strength parameters used in the stability analyses were based on laboratory test results of relatively undisturbed soil samples obtained from the onsite material. The following table summarizes the parameters used in the stability analysis.

| Analysis Type | Material | Strength Parameter | Friction Angle $\left(^{\circ}\right.$ ) | Cohesion (psf) | Unit Weight (pcf) |
| :--- | :--- | :--- | :---: | :---: | :---: |
| Surficial/Global | Alluvium | Ultimate Strength | $\phi=34.1$ | $\mathrm{C}=184$ | $\mathrm{Y}=120$ |

### 2.7.2 Surficial Stability

Surficial stability of the slope was analyzed for the onsite slope assuming an infinite $2 \mathrm{H}: 1 \mathrm{~V}$ slope with seepage parallel to the slope surface and consistent subsoil profile. The failure plane for this case is parallel to the surface of slope and the limit equilibrium method can be applied readily. The following factor of safety is derived from a homogeneous $\mathrm{c}-\phi$ soil based on effective stress analysis. The results of the analyses indicate that the existing slopes have a minimum factor of safety of 1.78 for surficial stability under static condition.

$$
\begin{array}{lllll}
\text { Factor of Safety }=\frac{C+H * \gamma_{b} * \cos ^{2}(\beta) \tan (\varphi)}{\gamma_{s a t} * H * \sin (\beta) \cos (\beta)} & \text { Where: } & \mathrm{H}= & 3 \mathrm{feet} & \text { (saturation zone) } \\
& \mathrm{Y}_{\mathrm{b}}= & 58 \mathrm{pcf} & \text { (buoyant soil unit weight) } \\
& Y_{\text {sat }}= & 130 \mathrm{pcf} & \text { (saturated soil unit weight) } \\
& \beta= & 26.6^{\circ} & \text { (slope angle) }
\end{array}
$$

Considering the shear strength of soil and the slope inclination, seasonal local surficial sloughing cannot be entirely precluded and should be considered by the project design team. Permanent devices should be designed by the project civil engineer such as but not limited to wall free board, " $V$ " ditches, benches, etc., to minimize and contain any remote pop-outs. In addition, to minimize the potential for surficial sloughing the slope should be maintained with appropriate deep root vegetation and ground cover.

### 2.7.3 Global Stability Analysis

Global stability analysis was performed to evaluate the probable static and dynamic gross stability of the existing slope configuration. The analyses utilize the simplified method of slices by Bishop through the software program GEOSTASE and the upper boundary theorem of plasticity through the software program LimitState:GEO. The results of the slope stability analyses are provided in Appendix E of this report.

The seismic stability of the site was calculated in conformance with the Southern California Earthquake Center (SCEC), 2002, "Recommended Procedures for Implementation of DMG Special Publication 117, Guidelines for Analyzing and Mitigating Landslide Hazards in California," and the California Geological Survey (CGS), Special Publication 117A, 2008 "Guidelines for Evaluating and Mitigating Seismic Hazards in California." A seismic coefficient ( $\mathrm{K}_{\text {eq }}$ ) of 0.473 was utilized in our analysis and was derived based on a maximum allowable displacement of 5 cm , a computed PGAm of 1.266 g , a moment magnitude of 7.9 , and a distance to the ground motion source of 1.3 km .

Our analyses indicate that the existing slopes have a minimum factor of safety of 3.08 and 1.28 under static and pseudo-static conditions, respectively. Based on our field observation and slope stability analyses, the existing slopes are considered stable.

Continuing stability of the slope will greatly depend on controlling the water, proper planting and maintaining the drainage for proper functioning. Drainage control measures recommended in this report and the project civil engineer should be implemented during site development.

### 3.0 TENTATIVE RECOMMENDATIONS

### 3.1 EARTHWORK RECOMMENDATIONS

The following recommendations are provided regarding aspects of the anticipated earthwork construction. These recommendations should be considered subject to revision based on additional geotechnical evaluation of the conditions observed by the Geotechnical Engineer during site development.

### 3.1.1 Site Clearing, Grubbing and Fill Removal

All debris, undocumented fill, abandoned utility lines, roots, irrigation appurtenances, underground structures, deleterious materials, etc., should be removed and hauled offsite. Cavities created during site clearance should be backfilled in a controlled manner.

### 3.1.2 Slab-on-Grade Preparation

The slab subgrade should be scarified to a depth of at least 8 -inches below proposed subgrade soil elevation, moisture conditioned, and recompacted to at least 90 percent relative compaction.

### 3.1.3 Footing Preparation

The footing excavations should be observed by the soil engineer. The footings should be excavated into competent native soil that is determined to be firm and unyielding. If loose soil is encountered in the bottom of the footing excavations, we recommend deepening the footing excavation into competent native material. The bottom of the excavation should be void from slough.

### 3.1.4 Trench Backfill

All utility trenches and retaining wall backfills should be mechanically compacted to the minimum requirements of at least 90 percent relative compaction. Onsite soils derived from trench excavations can be used as trench backfill except for deleterious materials. Soils with sand equivalent greater than 30 may be utilized for pipe bedding and shading. Pipe bedding should be required to provide uniform support for piping. Excavated material from footing trenches should not be placed in slab-on-grade areas unless properly compacted and tested.

### 3.1.5 Compacted Fills/Imported Soils

Any soil to be placed as fill, whether presently onsite or import, should be approved by the soil engineer or his representative prior to their placement. All onsite soils to be used as fill should be cleansed of any roots, or other deleterious materials. Rocks larger than 8-inches in diameter should be removed from soil to be used as compacted fill.

All fills should be placed in 6 - to 8 -inch loose lifts, thoroughly watered, or aerated to near optimum moisture content, mixed and compacted to at least 90 or 95 percent relative compaction depending on the material (subgrade soil or aggregate base) and application (pavement subgrade, building pad, etc.). This is relative to the maximum dry density determined by ASTM D1557 Test Method. Any imported soils should be sandy (preferably USCS "SM" or "SW", and very low in expansion potential) and approved by the soil engineer. The soil engineer or his representative should observe the placement of all fill and take sufficient tests to verify the moisture content and the uniformity and degree of compaction obtained.

### 3.2 TEMPORARY EXCAVATIONS

All excavation slopes and shoring systems should meet the minimum requirements of the Occupational Safety and Health (OSHA) Standards. Maintaining safe and stable slopes on excavations is the responsibility of the contractor and will depend on the nature of the soils and groundwater conditions encountered and his method of excavation. Excavations during construction should be carried out in such a manner that failure or ground movement will not occur. The contractor should perform any additional studies deemed necessary to supplement the information contained in this report for the purpose of planning and executing his excavation plan.

### 3.2.1 Cal/OSHA Soil Type

The subsurface soil expected to be encountered during site development may be classified as "Soil Type B" per the California Occupational Safety and Health Administration (Cal/OSHA).

### 3.2.2 Excavation Characteristics

The upper soil onsite is generally composed of medium dense silty sand with gravel which is not expected to exhibit difficult excavation resistance for typical excavating equipment in good working condition.

### 3.2.3 Safe Vertical Cuts

Temporary un-surcharged excavations of 4 feet high may be made at a vertical gradient for short periods of time. Temporary un-surcharged excavations greater than 4 feet may be trimmed back at $1 \mathrm{H}: 1 \mathrm{~V}$ gradients to a maximum height of 10 feet. Exposed conditions during construction should be verified by the project geotechnical engineer. No excavations should take place without the direct supervision of the project geotechnical engineer. If potentially unstable soil conditions are encountered, modifications of slope ratios for temporary cuts may be required.

### 3.2.4 Excavation Setbacks

No excavations should be conducted, without special considerations, along property lines, public right-ofways, or existing foundations, where the excavation depth will encroach within the "zone of influence". The "zone of influence" of the existing footings, property lines, or public right-of-way may be assumed to be below a 45 -degree line projected down from the bottom edge of the footing, property line, or right-of-way.

### 3.3 FOUNDATION RECOMMENDATIONS

The proposed ramp may be supported on conventional shallow foundation systems deriving support in competent native soil (see Section 3.1.3 Footing Preparation). Foundations should be deepened as necessary to penetrate through soft or disturbed soil at the discretion of the Geotechnical Engineer. All foundation excavations must be observed and approved by the Geotechnical Engineer's representative, prior to placing steel reinforcement or concrete.

### 3.3.1 Bearing Capacity

Spread, continuous, or pad-type foundations carried at least 36-inches below the lowest adjacent grade may be designed to impose a net dead-plus-live load pressure of 2000 psf. The bearing capacity may be increased 15 percent for every additional foot of embedment, to a maximum allowable bearing pressure of 2500 psf . A one-third increase may be used for wind or seismic loads.

### 3.3.2 Lateral Resistance

Resistance to lateral footing will be provided by passive earth pressure and base friction. For footings bearing against firm native material, passive earth pressure may be considered to be developed at a rate of 280 psf per foot of depth to a maximum of 2000 psf . Base friction may be computed at 0.40 times the normal load. If passive earth pressure and friction are combined to provide required resistance to lateral forces, the value of the passive pressure should be reduced to two-thirds the value.

### 3.3.3 Settlement

The onsite soils below the foundation depth have relatively high strengths and will not be subject to significant stress increases from foundations of the new structure. Therefore, estimated total long-term static and seismic settlement between similarly loaded adjacent foundation systems should not exceed 1inch. The structures should be designed to tolerate a differential settlement on the order of $1 / 2$-inch over a 30-foot span.

### 3.3.4 Reinforcement

Footing reinforcement should be determined by the structural engineer; however, minimum reinforcement should be at least two No. 4 reinforcing bars, top and bottom. Reinforcement and size recommendations presented in this report are considered the minimum necessary for the soil conditions present at the foundation level and are not intended to supersede the design of the project structural engineer or criteria of the governing agencies for the project.

### 3.4 SLABS-ON-GRADE

Slabs-on-grade should be at least 4-inches thick and reinforced with at least No. 4 bars at 16 -inches on-center both ways, properly centered in mid thickness of slabs. The structural engineer should design the actual slab thickness and reinforcement based on structural load requirements.

### 3.4.1 Modulus of Subgrade Reaction

A coefficient of vertical subgrade reaction ( Kv ) of 130 psi/in may be assumed for the building pad compacted fill soils. The modulus of subgrade reaction was estimated based on the NAVFAC 7.1 design charts. This value is for a small loaded area ( 1 sq . ft or less) such as for wheel loads or point loads and should be adjusted for larger loaded areas, as necessary.

### 3.4.2 Capillary Break \& Vapor Membrane

If vinyl or other moisture-sensitive floor coverings are planned, we recommend that the floor slab in those areas be underlain by a vapor membrane and capillary break consisting of a minimum 10-mil vapor-retarding membrane over a 4 -inch thick layer of clean sand. The 4-inch thick layer of sand should be placed between the subgrade soil and the membrane to decrease the possibility of damage to the membrane.

### 3.4.3 Slab Curling Precautions

A low-slump concrete should be used to minimize possible curling of the slab. Additionally, a layer of sand may be placed over the vapor retarding membrane to reduce slab curling. If this sand bedding is used, care should be taken during the placement of the concrete to prevent displacement of the sand. However, the need for sand and/or the thickness of sand above the moisture vapor barrier should be specified by the structural engineer or concrete contractor. The selection of sand above the barrier is not a geotechnical engineering issue and hence outside our purview.

### 3.4.4 Subgrade Exposure

Construction activities and exposure to the environment can cause deterioration of the prepared subgrade. Therefore, we recommend that our field representative observe the condition of the final subgrade soils immediately prior to slab-on-grade construction, and, if necessary, perform further density and moisture content tests to determine the suitability of the final prepared subgrade.

Additionally, the slab subgrade should be moisture conditioned to 2 to 4 percent above the optimum moisture content, to a depth of 12 inches. The moisture content of the floor slab subgrade soils should be verified by the geotechnical engineer within 24 hours prior to placing the vapor retarding membrane.

### 3.5 RETAINING WALLS

The following lateral earth pressures, in conjunction with the lateral resistance parameters provided in the Foundation Recommendations section of this report, may be used for the design of retaining walls with free draining compacted backfills. If passive earth pressure and friction are combined to provide required resistance to lateral forces, the value of the passive pressure should be reduced to two-thirds the following recommendations.

| Lateral Earth <br> Pressure Condition | Soil Backfill <br> Condition | Equivalent Fluid <br> Pressure (pcf) | Earth Pressure <br> Coefficient |
| :--- | :---: | :---: | :---: |
| Active Case (Drained) | Level | 34 | $\mathrm{~K}_{\mathrm{a}}=0.28$ |
| At-Rest Case (Drained) | Level | 53 | $\mathrm{~K}_{0}=0.44$ |
| Total Unit Weight of Soil | 120 pcf |  |  |

All retaining walls and block walls footings should be founded in compacted fill or firm native soils. We recommend drainage for retaining walls to be provided in accordance with Plate 3 of this report. Maximum precautions should be taken when placing drainage materials and during backfilling. All wall backfills should be properly compacted to at least 90 percent relative compaction.

### 3.6 SITE DRAINAGE

Positive drainage should be provided and maintained for the life of the project around the perimeter of all structures (including slopes and retaining walls) and all foundations toward streets or approved drainage devices to minimize water infiltrating into the underlying natural and engineered fill soils. In addition, finish subgrade adjacent to exterior footings should be sloped down (at least $2 \%$ ) and away to facilitate surface drainage. Perimeter water collection devices may be installed around the structure to collect roof/irrigation/natural drainage. Roof drainage should be collected and directed away from foundations via nonerosive devices. Over the slope drainage must not be permitted.

Water, either natural or by irrigation, should not be permitted to pond or saturate the foundation soils. Planter areas and large trees adjacent to the foundations are not recommended. All planters and terraces should be provided with drainage devices. Internal drainage should be directed to approved drainage collection devices.

Location of drainage device should be in accordance with the design civil engineer's drainage and erosion control recommendations. The owner should be made aware of the potential problems, which may develop when drainage is altered through construction of retaining walls, patios and other devices. Ponded water, leaking irrigation systems, over watering or other conditions which could lead to ground saturation should be avoided. Surface and subsurface runoff from adjacent properties should be controlled. Area drainage collection should be directed through approved drainage devices. All drainage devices should be properly maintained.

### 4.0 ADDITIONAL SERVICES

## Plan Reviews

The recommendations provided in this report are based on preliminary information and subsurface conditions as interpreted from limited exploratory boreholes at the site. We should be retained to review the final grading and foundation plans to revise our conclusions and recommendations, as necessary. Professional fees will apply for each review.

Our conclusions and recommendations should also be reviewed and verified during site grading and revised accordingly if exposed geotechnical conditions vary from our preliminary findings and interpretations.

## Additional Observation and/or Testing

GeoMat Testing Laboratories, Inc. should observe and/or test at the following stages of construction.

- During slab-on-grade scarification and compaction.
- Following footing excavation and prior to placement of footing materials.
- During wetting of slab subgrade and prior to placement of slab materials.
- During all trench backfill.
- When any unusual conditions are encountered.

## Final Report of Compaction During Grading

A final report of compaction control should be prepared subsequent to the completion of grading. The report should include a summary of work performed, laboratory test results, and the results and locations of field density tests performed during grading.

### 5.0 GEOTECHNICAL RISK

The concept of risk is an important aspect of the geotechnical evaluation. The primary reason for this is that the analytical methods used to develop geotechnical recommendations do not comprise an exact science. The analytical tools which geotechnical engineers use are generally empirical and must be used in conjunction with engineering judgment and experience. Therefore, the solutions and recommendations presented in the geotechnical evaluation should not be considered risk-free and, more importantly, are not a guarantee that the interaction between the soils and the proposed structure will perform as planned.

The engineering recommendations presented in the preceding sections constitute GeoMat Testing Laboratories professional estimate of those measures that are necessary for the proposed development to perform according to the proposed design based on the information generated and referenced during this evaluation, and GeoMat Testing Laboratories experience in working with these conditions.

### 6.0 LIMITATION OF INVESTIGATION

This report was prepared for the exclusive use on the new construction. The use by others, or for the purposes other than intended, is at the user's sole risk.

Our investigation was performed using the degree of care and skill ordinarily exercised, under similar circumstances, by reputable Geotechnical Engineers practicing in this or similar locations within the limitations of scope, schedule, and budget. No other warranty, expressed or implied, is made as to the conclusions and professional advice included in this report.

The field and laboratory test data are believed representative of the site; however, soil conditions can vary significantly. As in most projects, conditions revealed during construction may be at variance with preliminary findings. If this condition occurs, the possible variations must be evaluated by the Project Geotechnical Engineer and adjusted as required or alternate design recommended.

This report is issued with the understanding that it is the responsibility of the owner, or his representative, to ensure that the information and recommendations contained herein are brought to the attention of the engineer for the development and incorporated into the plans, and the necessary steps are taken to see that the contractor and subcontractor carry out such recommendations in the field.

This firm does not practice or consult in the field of safety engineering. We do not direct the contractor's operations, and we cannot be responsible for other than our own personnel on the site; therefore, the safety of others is the responsibility of the contractor. The contractor should notify the owner if he considers any of the recommended actions presented herein to be unsafe.

The findings, conclusions, and recommendations presented herein are based on our understanding of the proposed development and on subsurface conditions observed during our site work, and are valid as of the present date. However, changes in the conditions of a property can occur with the passage of time, whether they be due to natural processes or the works of man on this or adjacent properties. In addition, changes in applicable or appropriate standards may occur, whether they result from legislation or the broadening of knowledge.

GENERAL NOTES:
*Waterproofing should be provided where moisture nuisance problem through the wall is undesireable.
*Water proofing of the walls is not under the purview of the geotechnical engineer.
*All drains should have a gradient of 1 percent minimum.
*Outlet portion of the subdrain should have a 4-inch diamater solid pipe discharged into a suitable disposal area designed by the project engineer. The subdrain pipe should be accessible for maintenance (rodding).
*Other subdrain backfill options are subject to the review by the geotechnical engineer and modification of design parameters.

Notes:

1) Sand should have a sand equivalent of 30 or greater and may be densified by water jetting.
2) 1 Cu . ft. per ft. of $1 / 4$ - to $11 / 2$-inch size gravel wrapped in filter fabric
3) Pipe type should be ASTM D1527 Acrylonitrile Butadiene Styrene (ABS) SDR35 or ASTM D1785 Polyvinyl Chlorise plastic (PVC), Schedule 40, Armco A2000 PVC, or approved equivalent. Pipe should be installed with perforations down. Perforations should be $3 / 8$-inch in diameter placed at the ends of a $120-\mathrm{degre} \mathrm{\epsilon}$ arc in two rows at 3-inch on center (staggered).
4) Filter Fabric should be Mirafi 140NC or approved equivalent.
5) Weephole should be 3 -inch minimum diameter and provided at 10-foot maximum intervals. if exposure is permitted, weepholes should be located 12 -inches above finished grade. If exposure is not permitted, such as for a wall adjacent to a sidewalk/curb, a pipe under the sidewalk to be discharged through the curb face or equivalent should be provided. For a basement-type wall, a proper subdrain outlet system should be provided.
6) Retaining wall plans should be reviewed and approved by the geotechnical engineer.
7) Walls over six feet in height are subject to a special review by the geotechnical engineer and modifications to the above requirements.

Caltrans classifies a site as corrosive to structural concrete as an area where soil and/or water contains $>500 \mathrm{pp}$ chloride,$>2000 \mathrm{ppm}$ sulfate, or has a $\mathrm{pH}<5.5$. A minimum resistivity of less than 1000 ohm-cm indicates the potential for corrosive environment requiring testing for the above criteria.

The information in this form is not intended for corrosion engineering design. If corrosion is critical, a corrosion specialist should be contacted to provide further recommendations.

MOHR-COULOMB SOIL PARAMETERS
1 Type(s) of Soil Defined

Drained Shear Strength Reduction Factor applied after first stage $=1.0000$

TRIAL FAILURE SURFACE DATA
Circular Trial Failure Surfaces Have Been Generated Using A Random

Procedure.
1000 Trial Surfaces Have Been Generated.
1000 Surfaces Generated at Increments of 0.1562(in) Equally Spaced Within the Start Range

Unless XCLUDE Lines Were Specified, The Minimum Elevation To Which A Surface Extends Is $Y=80.00(f t)$

Specified Maximum Radius $=10000.000(f t)$
3.000(ft) Line Segments Were Used For Each Trial Failure Surface.

Restrictions Have Been Imposed Upon The Angle Of Initiation. The Angle Has Been Restricted Between The Angles Of -60.0 And -30.0 deg.

The Spencer Method Was Selected for FS Analysis.
Selected fx function = Constant (1.0)
Selected Convergence parameters for spencer method:
Initial estimate of $\mathrm{FS}=1.500$
FS tolerance $=0.000001000$
Initial estimate of theta(deg) $=15.00$
Theta tolerance(radians) $=0.0001000$
Minimum theta(deg) = -45.00 ; Maximum theta(deg) = 45.00
Theta convergence Step Factor $=5000.00$
Maximum number of iterations $=50$
Allowable negative side force $=-1000.0(\mathrm{lbs})$
Maximum force imbalance $=100.000000(l \mathrm{lbs})$
Maximum moment imbalance = 100.000000 (ft/lbs)
Selected Lambda Coefficient = 1.00
Specified Tension Crack Water Depth Factor $=0.000$
Total Number of Trial Surfaces Attempted $=1000$
WARNING! The Factor of Safety Calculation for one or More Trial Surfaces Did Not Converge in 50 Iterations.

Number of Trial Surfaces with Non-Converged FS = 7
Number of Trial Surfaces With Valid FS = 993

Percentage of Trial Surfaces With Non-Converged and/or Non-Valid FS Solutions of the Total Attempted = $0.7 \%$

Statistical Data On All Valid FS Values:
FS Max $=5.926$ FS Min $=3.476$ FS Ave $=3.865$ Standard Deviation = 0.327 Coefficient of Variation $=\quad 8.47 \%$

Critical Surface is Sequence Number 287 of Those Analyzed.

```
*****BEGINNING OF DETAILED GEOSTASE OUTPUT FOR CRITICAL SURFACE FROM A SEARCH*****
BACK-CALCULATED CIRCULAR SURFACE PARAMETERS:
Circle Center At X = 53.074129(ft) ; Y = 156.875345(ft); and Radius \(=49.730029(f t)\)
```

NOTE: A value of $0.000-$ for $h / H$ indicates that the line of thrust is at or below the lower boundary of the sliding mass. A value of $1.000+$ for $\mathrm{h} / \mathrm{H}$ indicates that
the line of thrust is at or above the upper boundary of the sliding mass.

MOHR-COULOMB SOIL PARAMETERS
1 Type(s) of Soil Defined

|  | Soil Number |  |  |  |  |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| WaterWater <br> and | Moist | Saturated | Cohesion Friction | Pore | Pressure |
| SurfaceOption <br> Description | (pcf) Unit Wt. Intercept | (pcf) | Angle | Pressure Constant |  |

Drained Shear Strength Reduction Factor applied after first stage $=1.0000$
SEISMIC (EARTHQUAKE) DATA
Specified Peak Ground Acceleration Coefficient (PGA) $=0.000(\mathrm{~g})$
Default Velocity $=0.000(f t)$ per second

```
Specified Horizontal Earthquake Coefficient (kh) = -.47300(g)
Specified Vertical Earthquake Coefficient (kv) = 0.000(g)
(NOTE:Input Velocity = 0.0 will result in default Peak
Velocity = 2 times(PGA) times 2.5 fps or 0.762 mps)
Specified Seismic Pore-Pressure Factor = 0.000
Horizontal Seismic Force is Applied at Center of Gravity of Slices
```

TRIAL FAILURE SURFACE DATA

Circular Trial Failure Surfaces Have Been Generated Using A Random Procedure.

1000 Trial Surfaces Have Been Generated.

1000 Surfaces Generated at Increments of 0.3003 (in) Equally Spaced Within the Start Range

Along The Specified Surface Between $X=0.00(f t)$
and $X=25.00(f t)$

Each Surface Enters within a Range Between $X=50.00(f t)$ and $X=70.00(f t)$

Unless XCLUDE Lines Were Specified, The Minimum Elevation To Which A Surface Extends Is $Y=$ 90.00(ft)

Specified Maximum Radius $=10000.000(f t)$
$3.000(f t)$ Line Segments Were Used For Each Trial Failure Surface.

Restrictions Have Been Imposed Upon The Angle Of Initiation. The Angle Has Been Restricted Between The Angles Of -60.0 And -30.0 deg.

The Spencer Method Was Selected for FS Analysis.

Selected fx function = Constant (1.0)

SELECTED CONVERGENCE PARAMETERS FOR SPENCER METHOD:
Initial estimate of $\mathrm{FS}=1.500$
FS tolerance $=0.000001000$
Initial estimate of theta(deg) $=15.00$
Theta tolerance(radians) $=0.0001000$
Minimum theta $(\mathrm{deg})=-45.00$; Maximum theta $(\mathrm{deg})=45.00$
Theta convergence Step Factor $=5000.00$
Maximum number of iterations $=50$
Allowable negative side force $=-1000.0(l b s)$

```
Maximum force imbalance = 100.000000(lbs)
Maximum moment imbalance = 100.000000 (ft/lbs)
    Selected Lambda Coefficient = 1.00
    Specified Tension Crack Water Depth Factor = 0.000
    Total Number of Trial Surfaces Attempted = 1000
    Number of Trial Surfaces With Valid FS = 1000
Statistical Data On All Valid FS Values:
        FS Max = 2.695 FS Min = 1.283 FS Ave = 1.465
        Standard Deviation = 0.129 Coefficient of Variation = 8.83 %
Critical Surface is Sequence Number 282 of Those Analyzed.
    *****BEGINNING OF DETAILED GEOSTASE OUTPUT FOR CRITICAL SURFACE FROM A
    BACK-CALCULATED CIRCULAR SURFACE PARAMETERS:
    Circle Center At X = 51.794006(ft) ; Y = 176.274798(ft); and Radius
```

SOIL OPTIONS:
A = ANISOTROPIC SHEAR STRENGTH
C = CURVED STRENGTH ENVELOPE (TANGENT PHI \& C)
F = FIBER-REINFORCED SOIL (FRS)
$M=$ INDEPENDENT MULTI-STAGE SHEAR STRENGTH
$N=$ NONLINEAR UNDRAINED SHEAR STRENGTH
R = RAPID DRAWDOWN OR RAPID LOADING (SEISMIC) SHEAR STRENGTH
NOTE: Phi and C in Table 4 are modified values based on specified Soil Options (if any).

## About this Report

This report has been generated using LimitState:GEO, a software application capable of directly identifying the critical collapse mechanism for a wide variety of geotechnical stability problems, including those involving slopes, retaining walls, footings etc.

The software utilizes the Discontinuity Layout Optimization (DLO) procedure to obtain a solution (Smith and Gilbert 2007). The main steps involved are: (i) distribution of nodes across the problem domain; (ii) connection of every node to every other node with potential discontinuities (e.g. slip-lines); (iii) application of rigorous optimization techniques to identify the critical subset of potential discontinuities, and hence also the critical failure mechanism and margin of safety.

The accuracy of the DLO solution is controlled by the specified nodal density. Within the set of all possible discontinuities linking pairs of nodes, all potential translational failure mechanisms are considered, whether anticipated or not by the engineer. Failure mechanisms involving rotations along the edges of solid bodies in the problem can also be identified. Thus in this case the solution identified by the DLO procedure is guaranteed to be the most critical solution for the problem posed. This means that there is no need to prescribe any aspect of the collapse mechanism prior to an analysis, or to separately consider different failure modes. The critical mechanism and collapse load factor are determined according to the well established upper bound theorem of plasticity.

LimitState:GEO reports the solution to a problem both visually as a collapse mechanism and numerically in terms of an Adequacy Factor, which is defined as the factor by which specified loads must be increased, or material strengths decreased, in order for the system under consideration to reach a collapse state.

## About this Report

This report has been generated using LimitState:GEO, a software application capable of directly identifying the critical collapse mechanism for a wide variety of geotechnical stability problems, including those involving slopes, retaining walls, footings etc.

The software utilizes the Discontinuity Layout Optimization (DLO) procedure to obtain a solution (Smith and Gilbert 2007). The main steps involved are: (i) distribution of nodes across the problem domain; (ii) connection of every node to every other node with potential discontinuities (e.g. slip-lines); (iii) application of rigorous optimization techniques to identify the critical subset of potential discontinuities, and hence also the critical failure mechanism and margin of safety.

The accuracy of the DLO solution is controlled by the specified nodal density. Within the set of all possible discontinuities linking pairs of nodes, all potential translational failure mechanisms are considered, whether anticipated or not by the engineer. Failure mechanisms involving rotations along the edges of solid bodies in the problem can also be identified. Thus in this case the solution identified by the DLO procedure is guaranteed to be the most critical solution for the problem posed. This means that there is no need to prescribe any aspect of the collapse mechanism prior to an analysis, or to separately consider different failure modes. The critical mechanism and collapse load factor are determined according to the well established upper bound theorem of plasticity.

LimitState:GEO reports the solution to a problem both visually as a collapse mechanism and numerically in terms of an Adequacy Factor, which is defined as the factor by which specified loads must be increased, or material strengths decreased, in order for the system under consideration to reach a collapse state.

| S115* | V112 $(11.1549,124.672)$ | B127 |  |  |
|  | V111 $(9.84252,124.672)$ | B128 | $3.28084 / 3.28084$ | Concrete |
|  | V113 $(9.84252,124.672)$ | B131 |  |  |

* Loaded solid (self weight).

## Water Table

(all distances in ft)

| Water Table Status | Vertices ( $\mathbf{x}, \mathbf{y}$ ) |
| :---: | :---: |
| Enabled | (No water table points defined) |

## Water Regimes

(potentials in ft, pressures in psf (lb/ft²))
(No water regime defined)

## Materials

(unit weights (weight densities) in pcf (lb/fti3), strengths in psf (lb/ft²), angles in degrees, datum level in ft, undrained strength gradient in psf (lb/ftr$) / f t)$

## Mohr-Coulomb Material(s)

| Key | Name | Unit Weight <br> (Saturated Unit <br> Weight) | Drainage Behaviour | $\mathbf{c}^{\prime}\left(\phi^{\prime}\right)$ | $\mathbf{c}_{u}$ (datum) (gradient) <br> (grid) |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | Concrete | $146.415(146.415)$ | Always undrained | $0(0)$ | $208854^{*}\left(0^{*}\right)\left(0^{*}\right)(-)$ |
|  | Frictionless | $0(0)$ | Always drained | $0^{*}\left(0^{*}\right)$ | $0(0)(0)(-)$ |
|  | Silty Sand with Gravel | $120(130)$ | Drained/undrained | $184^{\star}\left(34.1^{*}\right)$ | $0(0)(0)(-)$ |

*Property used in Scenario 1 (described in this report).

## Partial Factors

| Factor | User$^{\star}$ |  |  |  |
| :---: | :---: | :--- | :--- | :--- |
| Unfavourable: permanent | 1 |  |  |  |
| Unfavourable: variable | 1 |  |  |  |
| Unfavourable: accidental | 1 |  |  |  |
| Favourable: permanent | 1 |  |  |  |
| Favourable: variable | 1 |  |  |  |
| Favourable: accidental | 1 |  |  |  |

## limitstate

## limitstate 1 geo

| $\mathrm{c}^{\prime}$ | 1 |  |  |  |
| :---: | :---: | :--- | :--- | :--- |
| $\tan \phi^{\prime}$ | 1 |  |  |  |
| $\mathrm{c}_{u}$ | 1 |  |  |  |

${ }^{*}$ These partial factors were used in Scenario 1 (described in this report).

## Loads

(normal and shear loads in psf (lb/ft²))

## Boundary Objects

| Loaded Object | Type | Loading Type | Adequacy? | Normal | Shear |
| :---: | :---: | :---: | :---: | :---: | :---: |
| B6 | Permanent Load | neutral | false | 499.999 | 0 |
| B25 | Permanent Load | neutral | false | 499.999 | 0 |
| B44 | Permanent Load | neutral | false | 499.999 | 0 |
| B65 | Permanent Load | neutral | false | 499.999 | 0 |
| B86 | Permanent Load | neutral | false | 499.999 | 0 |
| B127 | Variable Load | neutral | true | 2000 | 0 |

## Solid Objects

| Loaded Object | Type | Loading Type | Adequacy? |
| :---: | :---: | :---: | :---: |
| S1 | Permanent (unfactored self weight: $146.415 \mathrm{pcf}\left(\mathrm{lb} / \mathrm{ft}^{3}\right)$ ) | neutral | true |
| S6 | Permanent (unfactored self weight: $146.415 \mathrm{pcf}\left(\mathrm{lb} / \mathrm{ft}^{3}\right)$ ) | neutral | true |
| S7 | Permanent (unfactored self weight: $146.415 \mathrm{pcf}\left(\mathrm{lb} / \mathrm{ft}^{3}\right)$ ) | neutral | true |
| S8 | Permanent (unfactored self weight: $146.415 \mathrm{pcf}\left(\mathrm{lb} / \mathrm{ft}^{3}\right)$ ) | neutral | true |
| S9 | Permanent (unfactored self weight: $146.415 \mathrm{pcf}\left(\mathrm{lb} / \mathrm{ft}^{3}\right)$ ) | neutral | true |
| S10 | Permanent (unfactored self weight: $146.415 \mathrm{pcf}\left(\mathrm{lb} / \mathrm{ft}^{3}\right)$ ) | neutral | true |
| S13 | Permanent (unfactored self weight: $146.415 \mathrm{pcf}\left(\mathrm{lb} / \mathrm{ft}^{3}\right)$ ) | neutral | true |
| S14 | Permanent (unfactored self weight: $146.415 \mathrm{pcf}\left(\mathrm{lb} / \mathrm{ft}^{3}\right)$ ) | neutral | true |
| S15 | Permanent (unfactored self weight: $146.415 \mathrm{pcf}\left(\mathrm{lb} / \mathrm{ft}^{3}\right)$ ) | neutral | true |
| S17 | Permanent (unfactored self weight: $146.415 \mathrm{pcf}\left(\mathrm{lb} / \mathrm{ft}^{3}\right)$ ) | neutral | true |
| S18 | Permanent (unfactored self weight: $120 \mathrm{pcf}\left(\mathrm{lb} / \mathrm{ft}^{3}\right)$ ) | neutral | true |
| S112 | Permanent (unfactored self weight: $146.415 \mathrm{pcf}\left(\mathrm{lb} / \mathrm{ft}^{3}\right)$ ) | neutral | true |
| S114 | Permanent (unfactored self weight: $146.415 \mathrm{pcf}\left(\mathrm{lb} / \mathrm{ft}^{3}\right)$ ) | neutral | true |
| S115 | Permanent (unfactored self weight: $146.415 \mathrm{pcf}\left(\mathrm{lb} / \mathrm{ft}^{3}\right)$ ) | neutral | true |
